

Using AI for Data Insights

Prompts

Step 1: Description

- **Prompt 1**

- List all the columns in the attached spreadsheet and show me a sample of data from each column.

- **Prompt 2**

- Take 5 more random samples of the data for each column to make sure you understand the format and type of information in each column.

- **Prompt 3**

Run a data quality check on each column. Specifically look for:

1. Missing, null, or empty values (give me counts and percentages)
2. Unexpected formats or data types
3. Outliers or suspicious values

Step 2: Introspection

- **Prompt 1**

- Tell me 10 interesting questions we could answer with this dataset and explain why each would be valuable.

- **Prompt 2**

For [these questions], tell me exactly which columns you'd need to use and whether the current data is sufficient to answer it.

- **Prompt 3**

- What questions do you think someone would WANT to ask about this data but we CAN'T answer due to missing information?
- Joining two datasets together
 - I just received this dataset from a colleague. Your task is to explore and explain the relationships between this new dataset with the original one and how they might be used to join data together.

Step 3: Goal Setting

- **Prompt**

- My goal is to understand specify your goal. Given this goal, which aspects of the data should we focus on?

Bonus

- **Prompt**

- What are the key questions someone reading my analysis would ask, and how should we proactively address them?
